13

14 **Preface**

15

16 The document herein was produced by the International Medical Device Regulators Forum (IMDRF),
17 a voluntary group of medical device regulators from around the world. The document has been
18 subject to consultation throughout its development.

19

20 There are no restrictions on the reproduction, distribution or use of this document; however,
21 incorporation of this document, in part or in whole, into any other document, or its translation into
22 languages other than English, does not convey or represent an endorsement of any kind by the
23 International Medical Device Regulators Forum.

24

25 **1.0 Introduction**

26 It is anticipated that convergence of requirements for clinical evidence, including common data
27 submissions, will lead to better understanding of medical device safety, clinical performance,
28 and/or effectiveness by all stakeholders, more efficient use of resources of the clinical
29 community, medical device regulators and industry, and increased transparency and confidence
30 in the global regulatory model. Ultimately, there should be more efficient, predictable and
31 timely access to safe and effective medical technology by patients and society worldwide.
32

33 **Clinical evidence and the Essential Principles of safety and performance of medical devices**

34

35 The IMDRF *Essential Principles of Safety and Performance of Medical Devices and IVD*
36 *Medical Devices* (the Essential Principles) set out the requirements relating to the safety and
37 performance of medical devices. Of these, Essential Principles 5.1.1, 5.1.6, 5.1.7 and 5.1.9 in
38 particular require that a medical device achieve its intended performance during normal
39 conditions of use and that the known, and foreseeable risks, and any undesirable side-effects, are
40 minimised and acceptable when weighed against the benefits of the intended performance.
41

42 The diversity of medical devices and the technologies on which they are based pose special
43 challenges for manufacturers, conformity assessment bodies and regulators alike when trying to
44 identify what should constitute evidence sufficient to demonstrate compliance with the Essential
45 Principles. Some technologies have been available for many years and are well characterised
46 from a safety, clinical performance, and/or effectiveness viewpoint. On the other hand, many
47 devices utilise new, state-of-the-art technology that has had little prior application in the
48 treatment of humans.

49 Furthermore, their intended purpose and clinical application can vary widely with end results
50 influenced by a wide range of different and differently experienced end-users.

51

52 Given the complexity of the medical devices milieu, the assessment of what is acceptable clinical
53 evidence for the purpose of demonstrating compliance with the Essential Principles must be
54 undertaken on a case-by-case basis. To this end, it is important to have an understanding of how
55 medical devices are brought to market and of the role that clinical data and its evaluation plays in
56 this process.

57 This document supersedes an earlier version produced under the Global Harmonization Task
58 Force (GHTF) with the same title in May, 2007(GHTF/SG5/N1R8:2007).

59

60

61 **2.0 Scope**

62 This document is intended to:

- 63 • introduce the concepts of clinical evaluation and clinical evidence;
- 64 • examine the relationship between clinical investigation, clinical data, clinical evaluation and
65 clinical evidence; and
- 66 • serve as guidance to all those involved in the generation, compilation and review of clinical
67 evidence sufficient to support the marketing of medical devices (regulatory authorities,
68 conformity assessment bodies, manufacturers of medical devices and their associated
69 industry groups).

70

71 The definitions and concepts contained within this document are intended to apply to the
72 establishment and maintenance of conformity with the relevant Essential Principles for medical
73 devices generally. Specific guidance will be developed in other documents in relation to *in vitro*
74 diagnostic devices. Similarly, guidance about how to generate, compile and present clinical
75 evidence for the purpose of demonstrating compliance with the Essential Principles for safety
76 and performance of a medical device will be addressed in future documents.

90

91 **4.0 Definitions and Concepts**

92

93 **4.1 Clinical investigation**

94

95 *Definition:* Any systematic investigation or study in or on one or more human subjects,

96 undertaken to assess the safety, clinical performance, and/or effectiveness
 97 of a medical device.

98
 99 *Explanation:* This term is synonymous with ‘clinical trial’ and ‘clinical study’.

100
 101 An effective medical device has the ability to provide clinically significant results
 102 in a significant portion of the target population; effectiveness is established using
 103 documented scientific evidence that a medical device is effective.

104
 105 Clinical investigations include feasibility studies and those conducted for the
 106 purpose of gaining market approval, as well as investigations conducted following
 107 marketing approval.

108
 109
 110 **4.2 Clinical data**

111
 112 *Definition:* Safety, clinical performance, and/or effectiveness information that is generated
 113 from the clinical use of a medical device.

114
 115 *Explanation:* Sources of clinical data may include:

- 116 (i) results of pre- and post-market clinical investigation(s) of the device
 117 concerned
- 118 (ii) results of pre- and post-market clinical investigation(s) or other studies
 119 reported in the scientific literature of a justifiably comparable device
- 120 (iii) published and/or unpublished reports on clinical experience of either the
 121 device in question or a justifiably comparable device
- 122 (iv) other sources of clinical experience such as registries and adverse event
 123 databases

124
 125
 126 **4.3 Clinical evaluation**

127
 128 *Definition:* A set of ongoing activities that use scientifically sound methods for the
 129 assessment and analysis of clinical data to verify the safety, clinical performance,
 130 and/or effectiveness of the device when used as intended by the manufacturer.

131
 132 *Explanation:* This is a process undertaken by manufacturers of medical devices to help establish
 133 compliance with the relevant Essential Principles for safety and performance. The
 134 result of this process is a report that can be reviewed by conformity assessment
 135 bodies and regulators and which details the extent of available data and its quality
 136 and demonstrates how the compliance with the Essential Principles is satisfied by
 137 the clinical data. Clinical evaluation is an ongoing process - information about
 138 safety and clinical performance, and/or effectiveness (e.g. adverse event reports,
 139 results from any further clinical investigations, published literature etc.) should be
 140 monitored routinely by the manufacturer once the device is available on the
 141 market and the benefits and risks reassessed in light of this additional
 142 information.

143
 144 Effectiveness is established using documented scientific evidence that a medical

145 device is effective.

146
147 The inputs for clinical evaluation are primarily clinical data in the form of clinical
148 investigation reports, literature reports/reviews and clinical experience. The data
149 required to establish the initial evidence of compliance with the Essential
150 Principles may vary according to the characteristics of the device, its intended use,
151 the claims made by the manufacturer, the existence and adequacy of warnings and
152 other restrictions, and the extent of experience with its use. A key goal of the
153 clinical evaluation is to establish that any risks associated with the use of the
154 device are acceptable when weighed against the benefits to the patient and are
155 compatible with a high level of protection of health and safety. The clinical
156 evaluation will, therefore, also need to cross-reference risk management
157 documents.

160 4.4 Clinical evidence

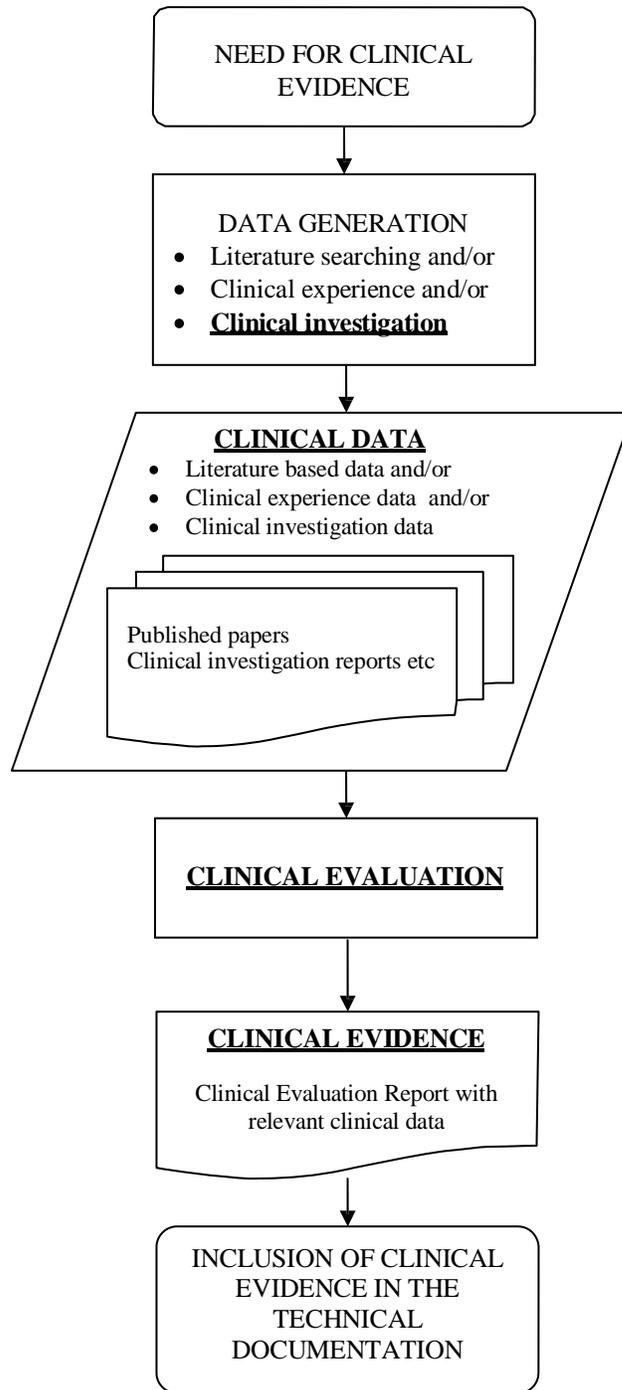

161
162 *Definition:* The clinical data and the clinical evaluation report pertaining to a medical device.

163
164 *Explanation:* Clinical evidence is an important component of the technical documentation of a
165 medical device, which along with other design verification and validation
166 documentation, device description, labelling, risk analysis and manufacturing
167 information, is needed to allow a manufacturer to demonstrate conformity with
168 the Essential Principles. It should be cross-referenced to other relevant parts of
169 the technical documentation that impact on its interpretation.

170
171 In accordance with applicable local regulations, clinical evidence, in part or in
172 total, may be submitted to and reviewed by conformity assessment bodies and
173 regulatory authorities. The clinical evidence is used to support the marketing of
174 the device, including any claims made about the safety, clinical performance,
175 and/or effectiveness of the device, and the labelling of the device. Figure 1
176 shows how the need for clinical evidence drives the processes of data generation
177 and clinical evaluation, which produce clinical data and clinical evidence,
178 respectively.

179
180 Clinical evidence should be reviewed and updated throughout the product life
181 cycle by the manufacturer as new information relating to safety, clinical
182 performance, and/or effectiveness is obtained from clinical experience during
183 marketing (e.g. adverse event reports, results from any further clinical
184 investigations, formal post market surveillance studies) of the device in question
185 and/or comparable devices.
